- **The Endocannabinoid System**

The brain, organs, and immune system all contain the intricate cell-signaling system known as the ECS. It is essential to the control of several physiological functions, including sleep, hunger, pain, and mood. Three primary elements make up the ECS:

- Endocannabinoids: Cannabinoid receptors are bound to by naturally occurring substances in the body.
- Cannabinoid receptors: Found on cell surfaces, these receptors interact with endocannabinoids and cannabinoids such as CBD. CB1 receptors are mostly present in the brain and central nervous system; CB2 receptors are mostly found in the immune system and peripheral organs.

Once an endocannabinoid has served its purpose, enzymes break it down.
