What Is Phentermine?

Phentermine is an FDA-approved prescription medication used for **short-term weight management** in adults who are overweight or obese. It works by stimulating the central nervous system to **suppress appetite**, helping patients adhere to a reduced-calorie diet and regular exercise plan.

Doctors typically prescribe Phentermine for a few weeks as part of a broader, supervised weight-loss program. Because it affects the body's metabolism and carries a potential for misuse, it is dispensed **only through licensed prescribers and pharmacies**.
